

## 95629 – Maria Campos – Vastaamo Psychotherapy Patients Jack Data Breach

This CMap describes how the Vastaamo database was leaked due to a faulty design of the database, which violated the principles of cybersecurity since it had severe confidentiality issues like not anonymizing or encrypting the records, and how it could have been avoided if the proper professionals were hired to manage the security service and respond to vulnerabilities and check for security breaches in the system along with other related security measures, like a MSSP, CERT and performing DPA. All the data located there was leaked, which belonged to and uniquely identified the patients, who were unaware about how their data was being recorded so their rights to control how their data is handled were not respected.
